<p align="center"><b>Division of Forensic Science</b></p> <p align="center"><b>BLOODSTAIN PROCEDURES MANUAL</b></p>	<p>Amendment Designator:</p>
	<p>Effective Date: 15-October-2004</p>
<p align="center"><b>4 DISTRIBUTION DETERMINATION AND POSSIBLE INFORMATION</b></p> <p><b>4.1 Approach to Distribution Determination</b></p> <p>4.1.1 Utilizing four foot yellow scales (or more as needed), bracket the entire pattern both vertically and horizontally.</p> <p>4.1.2 Utilizing a 7x loupe or similar equipment with a mm scale attachment, measure the distance between stains in at least 4 locations within the 4 quadrants of the entire pattern area.</p> <p>4.1.3 View the pattern in its entirety from a distance to determine the characteristics of the distribution.</p> <p><b>4.2 Possible Information Obtained</b></p> <p>4.2.1 The extent of the entire pattern serves as an indicator of the distance from the stain's surface to the blood source at the time of blood release.</p> <p>4.2.2 The section where the distance between individual stains is the least is used as an indicator of the area of convergence or the center of blood release.</p> <p>4.2.3 Distribution types – Best observed when viewing the whole pattern in its entirety from a distance. Examples of distribution:</p> <p>4.2.3.1 Conical Mass – an impact from a gunshot</p> <p>4.2.3.2 In-line (linear) stain – cast off pattern of distribution.</p> <p>4.2.3.3 Chaotic – typical of expired where distribution appears conical but stain direction is irregular.</p> <p align="right">◆End</p>
